

y velocity (colour) with the interface (black)

Rayleigh-Plateau growth, $kr_0 = 0.7$

Interface shape: the capillary mode growing

Local growth rate, $kr_0 = 0.7$
(plateau reached)

(b) contours of the growth rate

(a) growth rate over the parameter plane

Linear growth extrapolated to break-up

Neck thinning and bulge growth

Interface through break-up

the interface observable needs no twin,
which halves the cost of a growth-rate study

replaces the constraining body force
 $B_f = \partial \bar{Q} / \partial t - F(\bar{Q})$,
which would require modifying
the solver
